Compose text and data entities is possible with AutoCAD. AutoCAD supports text typing directly in its composition windows, such as the drawing or property windows. Besides text typing, some of the most common uses of AutoCAD's composition window include entry of contact information, drawing and layout of common graphic objects, such as text, images, and symbols, and of notes and special instructions. The AutoCAD Composition dialogs are saved in a separate AutoCAD file and are similar to ActiveX controls in their runtime environment. AutoCAD also allows for the insertion of arbitrary numbers and dates using the Timestamp command, a.k.a. "@", which is represented onscreen as a green stamp. Drawings With AutoCAD, drawings are created by drawing symbols and text.

Each object can be deleted by selecting and pressing the Delete key. For drawing and drawing collections, this is a destructive process and the deleted objects can't be restored. However, objects in a drawing can be moved or copied to other drawings using the Move or Copy command. The components of a drawing can be viewed in the Components window, which appears when the drawing is selected in the drawing window. Component objects can also be cut, copied, and moved to other drawings. A geometric object or curve is composed by placing lines, arcs, circles, and Bézier curves or splines together. Usually, geometric objects can be deleted by clicking the X symbol in their title bar, selecting the Delete tool in the toolbar, and pressing the Delete key. A geometric object can also be moved and copied by selecting the object in the drawing window and using the corresponding commands. Customization AutoCAD can be customized using many ways. It can be customized with user interface, object's properties, macros, and scripts. User interface customization is made by modifying the interface using Interface Editor or User Interface Builder. Object's properties are added, modified, or deleted with the Properties palette or with the Properties Manager. Macro's are functions or procedures available from the Macro toolbar. Scripts are written using Lua, Visual LISP, AutoLISP, AutoBasic, Visual Basic, JavaScript, or Python, and can be invoked by selecting a command in the Ribbon toolbox. Interface Editor User interface customization can be made by modifying the design of the interface using the Interface Editor. Interface editor dialogs are available from the Tools menu.
